Diagnostic Essentials: Physical Health Conditions

GUIDANCE TO THE VICTIM COMPENSATION FUND FROM THE WORLD TRADE CENTER HEALTH PROGRAM

First Issued: 18 December 2013

Please note that the relevant policies pertaining to the medical professional determination on behalf of a claimant to the Victim Compensation Fund (VCF) may be found on the World Trade Center Health Program (WTCHP) website at http://www.cdc.gov/wtc/policies.html. The relevant policies include:

- Policy and Procedures to Certification of Physician Determination for Aerodigestive and Cancer Health Conditions
- Time Intervals for New Onset Aerodigestive Disorders
- Rare Cancers
- Minimum Latency & Types or Categories of Cancer
- Making a Determination about Exposure Aggravating Pre-Existing Aerodigestive Disorders

In general, the diagnosis of a health condition depends on a combination of medical history, physical examination, various types of diagnostic testing, including radiographic and other types of imaging, spirometry, and various laboratory and pathologic analyses. The WTCHP has recommended that diagnostic information listed in this document be utilized by the VCF to substantiate the diagnosis of claimed health conditions.

For each category of health conditions, a star superscript (*) is listed next to the types of information considered essential to support the medical professional determination of the underlying condition. In some categories, the clinician has a choice of which type of essential information is available in the medical record. Other clinical information that is not listed with a star superscript (*) may support a diagnosis of a health condition. The VCF will then have a licensed medical professional make a determination regarding the health conditions and attest to the linkage of the conditions to the individual’s 9/11 exposures. The determination is then submitted for a verification decision by the WTCHP in accordance with the policies and procedures of the WTCHP. The VCF renders the final decision regarding condition eligibility and subsequent consideration for compensation.
| Health Condition Category<sup>1</sup> | Diagnostic Information Needed for Physician Determination | Reference Guidelines Supporting the Medical Basis for Diagnostic Information by Type of Condition |
|-----------------------------------|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------
| Interstitial Lung Disease (ILD)<sup>2</sup> | Pulmonary disease:  
- History (Symptoms) & Physical Exam Findings  
- Pulmonary Function Tests (PFTs)/Spirometry  
- Radiographic/Imaging evidence for lung findings*  
- Bronchoalveolar lavage  

<sup>1</sup>The general categories of health conditions that are listed in this Table have been drawn from the List of Health Conditions for Responders found at 42 U.S.C. §§ 300mm-22[a][3][A] and 300mm—32(b)(1).  
<sup>2</sup> Interstitial lung disease (ILD) is a term used to describe the pulmonary manifestation of more than 100 health conditions. ILD is characterized by inflammation and/or fibrosis of the lungs. Some of the health conditions manifesting ILD may include, but are not limited to, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, sarcoidosis, eosinophilic granuloma, bronchiolitis obliterans, pneumoconioses, and certain systemic autoimmune diseases such as the connective tissue diseases (CTD), and small vessel vasculitides.

</table>

Note:
For WTC-exacerbated Chronic Obstructive Pulmonary Disease (COPD), there must be evidence that COPD was present prior to September 11, 2001 and worsened after exposure. 5
For new-onset COPD, there must be evidence that the COPD symptoms and persistent airflow limitation by spirometry started after September 11, 2001.

---

3 Obstructive airways disease (OAD) is a broad category of respiratory diseases which are characterized by varying degrees of reversible and irreversible airways obstruction and include chronic respiratory disorder (fumes/vapors), chronic cough syndrome, new onset and WTC-exacerbated COPD, asthma, and reactive airways dysfunction syndrome (RADS). Chronic cough is certifiable as a WTC-related chronic respiratory condition due to chemicals, gases, fumes, and vapors under the obstructive airway disease care suite.

4 Bronchiectasis is certifiable as WTC-related chronic respiratory disorder (fumes/vapors) and/or as a medically associated health condition to a certifiable WTC-related health condition under certain lung disease categories.

5 Evidence supporting a diagnosis of WTC-exacerbated COPD consists of one or more of the following: (1) a record of physician diagnosis of COPD made prior to the individual's 9/11 exposure; (2) history of symptoms of chronic cough, sputum production and/or dyspnea experienced prior to the individual's 9/11 exposure; (3) a history of recurrent bronchopulmonary infections experienced prior to the individual's 9/11 exposure; (4) a record of PFTs showing chronic airways obstruction existing prior to the individual's 9/11 exposure; and/or (5) a record of imaging studies consistent with COPD existing prior to the individual's 9/11 exposure.

6 Spirometric evidence of persistent airflow limitation is demonstrated by a post-bronchodilator fixed ratio of FEV1/FVC < 0.70.

8 A change page describes changes made to the document since it was posted on the Web in August 2007.

9 Upper airway inflammatory disorders is a broad category of health conditions; however, for the purpose of verification for VCF claims, the category is limited to include only the following conditions: chronic rhinosinusitis or chronic rhinitis (either irritant or allergic), chronic nasopharyngitis, chronic laryngitis, and upper airway hyperactivity.

\(^{10}\)In the case of a WTC responder only (i.e., not in the case of a survivor) who received any treatment for a WTC-related MSD on or before September 11, 2003, the list of health conditions that can be verified includes: (1) low back pain; (2) carpal tunnel syndrome (CTS); and (3) other musculoskeletal disorders. The term ‘WTC-related musculoskeletal disorder’ means a chronic or recurrent disorder of the musculoskeletal system caused by heavy lifting or repetitive strain on the joints or musculoskeletal system occurring during rescue or recovery efforts in the New York City disaster area in the aftermath of the September 11, 2001, terrorist attacks. See 42 U.S.C. § 300mm-22(a)(4).

<td>Chemistry Laboratory</td>
</tr>
<tr>
<td></td>
<td>Tissue biopsy or pathology report*</td>
</tr>
</tbody>
</table>

All malignant in-situ neoplasms are eligible for certification except the following: (1) lobular carcinoma in-situ of the breast (except pleomorphic lobular carcinoma); (2) in-situ carcinoma of the gallbladder; (3) colorectal in-situ carcinoma (high grade

intraepithelial and intramucosal neoplasia); and (4) in-situ carcinoma of the cervix.

| Malignant Neoplasm: Unknown primary | • History (Symptoms) & Physical Findings  
| | • Radiographic/Endoscopic/Imaging evidence  
| | • Chemistry Laboratory  
| | • Tissue biopsy or pathology report*  

When the diagnosis under review is a metastatic neoplasm of an unknown primary, a diagnostic work-up summary is required to demonstrate that an appropriate search for the primary malignancy was done. The narrative should include the metastases that have been detected as a result of the diagnostic evaluation.

When the diagnostic work-up does not reveal a primary site, the neoplasm shall be classified as C80.1 “Malignant (primary) neoplasm, unspecified.”

When the diagnostic work-up does reveal a primary site, the neoplasm shall be classified as a neoplasm of the primary site.

To ensure clarity about the condition for which verification is requested, the medical determination should only state the final diagnosis and the date of this diagnosis.

---
